Section-D.

Given, In circle with centre O.

    C is the mid-point of the arc AB

    Now, CT is a tangent to the circle

        at point C.

    Here, AB is a chord.
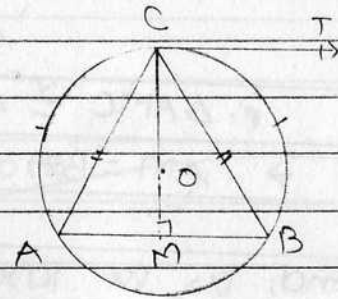

To prove:- CT ∥ AB

Const:- we join AC and BC

        we draw CM ⊥ AB

Proof:- Since, C is the mid-point of arc A$\widehat{C}$B

    So, $l(\widehat{AC}) = l(\widehat{BC})$

    ⇒   AC = BC   (chords subtended by equal arcs
                                  are equal)

    Now, △ACB is Isosceles △.

    Now,   In right △CMA and △CMB

               CM = CM   (common)

               ∠M = ∠M = 90° (by const.)

               AC = BC   (as proved)

$\therefore \triangle AMC \cong \triangle BMC$ (RHS)

$\rightarrow$ $AM = BM$ (CPCT)

And, as we know that a perpendicular that bisects the chord passes through the centre.

$\therefore$ CM passes through 0.

And, we know that a tangent is perpendicular to the radius through the point of contact.

$\therefore \angle OCT = 90°$

And, $\angle CMA = 90°$

But these are alternate $\angle s$

$\therefore$ CT || AB   proved

22. Let A be the required point of observation above the lake.
Let C be the position of cloud & E be

its reflection in the lake.

Here, $AF \perp CD$

Given, $\Rightarrow AB = DF = 20\,m$

$\angle CAF = 30°$

$\angle FAE = 60°$

Now, let the height of Cloud = $(H)\,m$

i.e $CD = DE = (H)\,m$

Then, $CF = CD - DF = (H-20)\,m$

And; $EF = ED + DF$
$= (H+20)\,m$

Now, in right $\triangle AFC$,

$$\tan 30° = \frac{CF}{AF} \Rightarrow \frac{1}{\sqrt{3}} = \frac{H-20}{AF}$$

$$\Rightarrow AF = \sqrt{3}(H-20) \quad - \text{①}$$

Similarly, in right $\triangle APE$,

$$\tan 60° = \frac{EF}{AF} \Rightarrow \sqrt{3} = \frac{H+20}{AF}$$

$$\Rightarrow AF = \frac{H+20}{\sqrt{3}} \quad - \text{①}$$

from ① & ⑪ , we get

or, $\sqrt{3}(H-20) = \dfrac{H+20}{\sqrt{3}}$

or, $3(H-20) = H+20$

or, $3H-60 = H+20$

or, $3H-H = 20+60$

or, $2H = 80$

or, $H = 40$ m

Now, $CF = (H-20)m$

$= (40-20) m = 20 m$

Hey, In right $\triangle AFC$,

$Sin 30° = \dfrac{\triangle F}{AC} \Rightarrow \dfrac{1}{2} = \dfrac{20}{AC}$

$\Rightarrow AC = 40m$

∴ Dist. of cloud from point $A = 40 m$

23. Total no. of cards in a deck $= 52$

(i) Let E_1 be the event of getting a card of spade or an ace.

No. of favourable events = $13 + 3 = 16$

Now, $P(\text{a spade or an ace}) = P(E_1) = \dfrac{16}{52} = \dfrac{4}{13}$

(ii) Let E_2 be the event of getting a black king.

No. of black kings $= 2$

$\therefore P(\text{black king}) = P(E_2) = \dfrac{2}{52} = \dfrac{1}{26}$

(iii) Let E_3 be the event of getting either a jack or a king.

No. of favourable events $= 4 + 4 = 8$

Now, $P(\text{either jack or king}) = P(E_3) = \dfrac{8}{52} = \dfrac{2}{13}$

Hen, $P(\text{neither jack nor king}) = P(\bar{E_3}) = 1 - P(E_3)$

$= 1 - \dfrac{2}{13} = \dfrac{13-2}{13} = \dfrac{11}{13}$

(iv) Let E_4 be the event of getting either a king or a queen.

No. of favourable events $= 8$

$\therefore P(\text{either king or queen}) = P(E_4) = \dfrac{8}{52} = \dfrac{2}{13}$

24. Given, PQRS is a square lawn of

side, PQ = 42 cm

Here, Two circular flower beds are

drawn on sides PS and QR with

O as centre.

Diagonals of sq. bisect each other at O.

Now, In right $\triangle RQP$, By pythagoras theorem

$$PR = \sqrt{(RQ)^2 + (PQ)^2} = \sqrt{(42)^2 + (42)^2}$$

$$= \sqrt{2(42)^2}$$

$$= 42\sqrt{2}\ cm$$

And, as we know that diagonals of a square

bisect each other at 90.

$$\therefore\ OS = OP = \frac{42\sqrt{2}}{2} = 21\sqrt{2}\ cm$$

And, $\angle POS = \angle ROQ = 90°$

Now, Req. shaded area = Area of 2 segments

with $r = 21\sqrt{2}\ cm\ \&\ O = 90°$

$$= 2 \times \frac{r^2}{2} \left[\frac{\pi \theta}{180} - \sin \theta \right]$$

$$= r^2 \left[\frac{\pi \times 90°}{180°} - \sin 90° \right]$$

$$= (21\sqrt{2})^2 \left[\frac{22}{14} - 1 \right]$$

$$= 441 \times 2 \left[\frac{22 - 14}{14} \right] = 441 \times 2 \left[\frac{8}{14} \right]$$
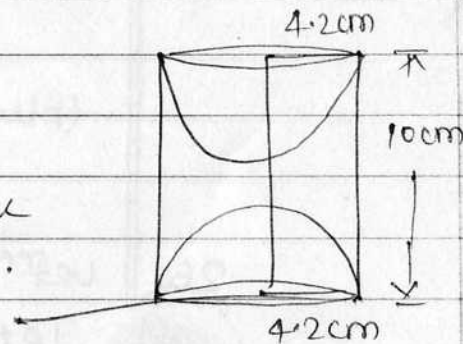

$$= 63 \times 8$$
$$= 504 \ m^2$$

25. Here, Height of cylinder $(H) = 10 \ cm$

Base radius $= 4.2 \ cm$

Now, Hemispheres of radius(r) $4.2 \ cm$ are scooped out from each end.

Now,

Vol^m of remaining solid $= \pi r^2 H - 2 \times \frac{2}{3} \pi r^3$

$$= \pi r^2 \times 10 - \frac{4}{3} \pi r^3$$

$$= \pi r^2 \left[10 - \frac{4r}{3} \right]$$

$$= \pi r^2 \left[\frac{30 - 4r}{3} \right] = \frac{22}{7} \times \frac{42}{10}_5 \times 4.2 \left[\frac{30 - 4(4.2)}{3} \right]$$

$$= \frac{22 \times 4.2 \times (30 - 16.8)}{5}$$

$$= \frac{22 \times 42 \times 132}{5 \times 10 \times 10} = \frac{924 \times 132}{5 \times 100} \text{ cm}^3$$

Now, the remaining solid is melted to form a wire of thickness 1.4 cm

Now, radius of wire $= \frac{1.4}{2}$ cm $= 0.7$ cm

Now, length of wire $= \dfrac{924 \times \overset{132}{\cancel{132}} \times 7 \times 100}{5 \times 100 \times \underset{2}{\cancel{22}} \times 0.7 \times 0.7}$

$$= \frac{792}{5} = 158.4 \text{ cm Ans}$$

26. Let ABCD be a rectangle.
Let the shorter side, $BC = x$ cm
Then, $AC = (x + 16)$ cm
And, $AB = (x + 14)$ cm
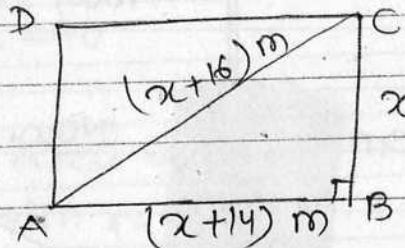

Now, In right $\triangle ABC$, By pythagoras theorem

$$AC^2 = AB^2 + BC^2$$

or, $(x+16)^2 = (x+14)^2 + x^2$

or, $x^2 + 256 + 32x = x^2 + 196 + 28x + x^2$

or, $2x^2 + 28x + 196 - x^2 - 32x - 256 = 0$

or, $x^2 - 4x - 60 = 0$, which is a Quad. eqn.

or, $x^2 - 10x + 6x - 60 = 0$

or, $x(x-10) + 6(x-10) = 0$

or, $(x-10)(x+6) = 0$

or, $x - 10 = 0$ | or, $x + 6 = 0$

or, $x = 10$ | or, $x = -6$ (Invalid)

Now, $BC = x = 10 \text{ cm}$

$AB = x+14 = (10+14) \text{ m} = 24 \text{ m}$

27. Given, A.P is $8, 10, 12 \cdots$

Here, $a = 8$, $d = 10 - 8 = 2$

Now, $a_{60} = a + (60-1)d$

$= 8 + (59 \times 2)$

$= 8 + 118 = 126$

Now, sum of the last 10 terms = sum of terms from 51st to 60th

i.e $951 + 952 - - - - + 960$

Now, $n = 10$

or, $951 = 8 + (51-1)2$
$= 8 + (50 \times 2) = 100 + 8 = 108 = $ (first term)

$\text{and } 960 = l = 126$

Now,

sum of last 10 term $= S_{10}$

$$= \frac{10}{2} [951 + 960]$$

$$= 5 [108 + 126]$$

$$= 5 [234] = 1170 \text{ Ans}$$

28. Let the avg. speed for a dist. of 75 km = x km/hr

Then, time taken to cover 75 km $= \left[\frac{75}{x}\right]$ hrs

Now, speed for the next 90 km $= (x+10)$ km/hr

Time taken to cover 90 km $= \left[\frac{90}{x+10}\right]$ hrs.

A/Q

$$\frac{75}{x} + \frac{90}{x+10} = 3$$

or, $1\overset{5}{\cancel{15}}\left[\frac{5}{x} + \frac{6}{x+10}\right] = \cancel{3}$

or, $\dfrac{5(x+10)+6x}{x^2+10x} = \dfrac{1}{5}$

or, $5x+50+6x = \dfrac{x^2+10x}{5}$

or, $(11x+50)5 = x^2+10x$

or, $x^2+10x-55x-250 = 0$

or, $x^2-45x-250 = 0$, which is a Quad. eqn

or, $x^2-50x+5x-250 = 0$

or, $x(x-50)+5(x-50) = 0$

or, $(x-50)(x+5) = 0$

or, $x-50 = 0$ | or, $x+5 = 0$

or, $x = 50$ | or, $x = -5$

                     (invalid)

first

∴ speed = $x = 50 \, \text{km/hr}$

29.   G' : In circle C(0,r)
     PQ is a tangent to the circle at
     M.
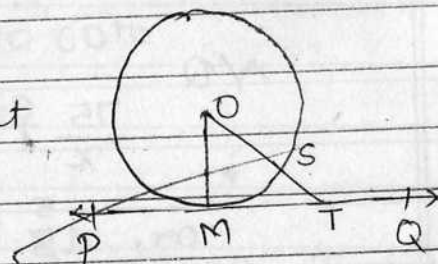

To prove:- OM ⊥ PQ

Const:- we take another point on PQ i.e T and
          joined it with O.
          The line intersects the circle at S

Proof:-   Here,   OM = OS = r

⇒ OT > OM (whole is greater
                        than a part)

or, OM < OT

∴ OM is the shortest dist.

And, as we know that the shortest dist from
a point to a line is the perpendicular dist.

∴ OM ⊥ PQ

So, A tangent is perpendicular to the radius
        through the point of contact.

30.
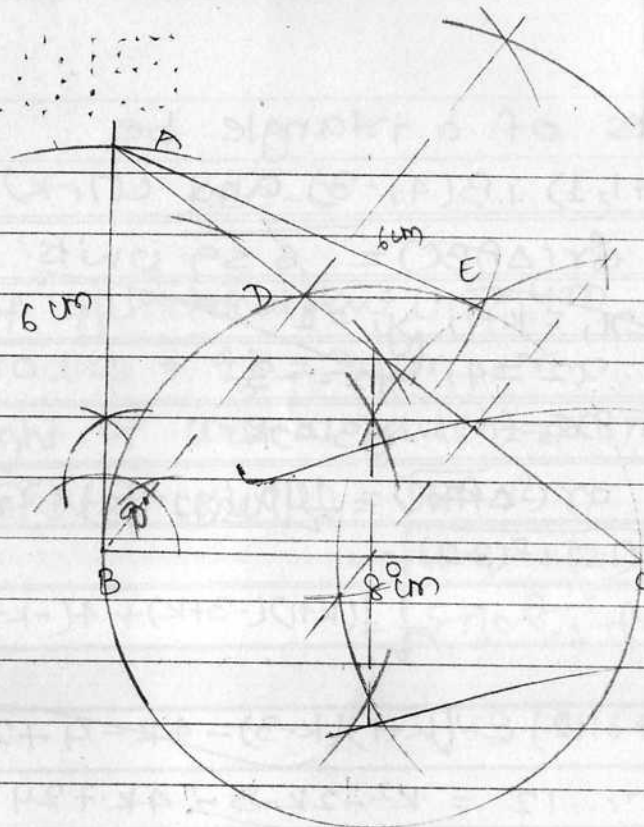

Steps:-

1. We draw $\triangle ABC$ with the given dimensions.

2. We draw a perpendicular to AC at D from B.

3. We draw a circle passing through B, C & D.

4. We draw tangent to the circle from A at B & E

$\therefore$ AB & AE are required tangents.

31. Given, Let vertices of a triangle be

$$A(K+1, 1), B(4, -3) \text{ and } C(7, -K)$$

Given, $ar(\triangle ABC) = 6$ sq. units.

Here, $x_1 = K+1, y_1 = 1$
$$x_2 = 4, y_2 = -3$$
$$x_3 = 7, y_3 = -K$$

Now, $ar(\triangle ABC) = \frac{1}{2}|x_1(y_2-y_3) + x_2(y_3-y_1) + x_3(y_1-y_2)|$

or, $6 = \frac{1}{2}|(K+1)(-3+K) + 4(-K-1) + 7(1+3)|$

or, $12 = (K+1)(K-3) - 4K - 4 + 28$

or, $12 = K^2 - 2K - 3 - 4K + 24$

or, $K^2 - 6K + 21 - 12 = 0$

or, $K^2 - 6K + 9 = 0$, which is a Quad. eqn.

or, $K^2 - 3K - 3K + 9 = 0$

or, $K(K-3) - 3(K-3) = 0$

or, $(K-3)(K-3) = 0$

or, $K-3 = 0$ | or, $K-3 = 0$

or, $K = 3$ | or, $K = 3$

$\therefore K = 3$

sec-C.

11.   Here, Height of cylindrical part $(H) = 4m$

Base radius $= \dfrac{4.2}{2} = 2.1\,m = r$

Now, Height of conical part $(h) = 2.8\,m$

Now, slant height of cone $(l) = \sqrt{h^2 + r^2}$

$$= \sqrt{(2.8)^2 + (2.1)^2}$$

$$= \sqrt{\{7(0.4)\}^2 + \{7(0.3)\}^2}$$

$$= \sqrt{49(0.16 + 0.09)} = 7\sqrt{0.25}$$

$$= 7 \times 0.5$$

$$= 3.5\,m$$

Req. area of canvas for making 1 tent

$$= C.S.A \text{ of cone} + C.S.A \text{ of cylinder}$$

$$= \pi r l + 2\pi r H$$

$$= \pi r [l + 2H] = \pi \times 2.1 [3.5 + 2 \times 4]$$

$$= \dfrac{22}{7} \times \dfrac{21}{10} [3.5 + 8]$$

$$= \dfrac{33}{5}[4.3] \, m^2$$

$$= \dfrac{33 \times 11.5}{10}$$

$$= \dfrac{33 \times 23}{10} \, m^2$$

Req. area of $\underset{\text{canvas}}{\text{tent}}$ for making 100 tents $= \overset{20}{\cancel{100}} \times \dfrac{33}{\cancel{5}} \times \dfrac{\cancel{9.3}}{\cancel{10}}$

$$= \dfrac{100 \times 33 \times 23}{\cancel{10}}$$

$$= (33 \times 230)\,m^2 = (66 \times 93)\,m^2$$

∵ Rate of canvas $= ₹ \ 100/m^2$

∴ cost ″ ″ $= ₹ \ 100 \times \cancel{66 \times 43} \ \ 33 \times 230$

$$= ₹ \ \cancel{6610 \times 43} = ₹ \ \cancel{283800}$$

$$= ₹ \ (3300 \times 230)$$

since, the welfare association will contribute 50%.

∴ Its contribution $= ₹ \dfrac{50}{100} \times \cancel{283860} \ \ 3300 \times 230$
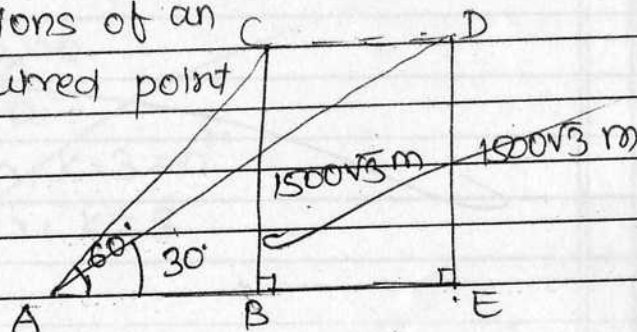

$$= ₹ \ \ \ \ \ \cancel{141900} \ \ \ \ 16500 \times 23$$

$$= ₹ \ \ \ \ \ \ \ 379500$$

The associations are very social, helpful, generous & kind.

12. Let C & D be the two positions of an aeroplane & A be the required point on the ground.

Here, CB ⊥ AE & DE ⊥ AE

Given, ∠CAB = 60°, ∠DAE = 30°

$$BC = DE = 1500\sqrt{3} \text{ m}$$

Now, Time taken to reach D from C = 15 s

Now, In right $\triangle DEA$,

$$\tan 30° = \frac{DE}{AE} \Rightarrow \frac{1}{\sqrt{3}} = \frac{1500\sqrt{3}}{AE}$$

$$\Rightarrow AE = 4500 \quad — \text{①}$$

Similarly, In right $\triangle ABC$,

$$\tan 60° = \frac{BC}{AB} \Rightarrow \sqrt{3} = \frac{1500\sqrt{3}}{AB}$$

$$\Rightarrow AB = 1500 \quad — \text{②}$$

Subtracting ② from ①, we get

or, $AE - AB = 4500 - 1500 = 3000$

or, $BE = 3000 \text{ m}$

So, $CD = 3000 \text{ m} = 3 \text{ km}$

∴ Time taken to cover $CD = 15 s = \frac{15}{3600}$ hrs
$$\frac{}{240}$$
$$= \frac{1}{240} \text{ hrs}$$

∴ Speed of aeroplane $= \frac{3 \times 240}{1} \text{ km/hr}$

$$= 720 \text{ km/hr}$$

13. Here, internal diameter of a
hemispherical bowl $= 36$ cm

36 cm

$\Rightarrow$ radius $= R = 18$ cm
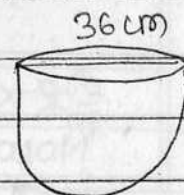

A/Q

The liquid of the bowl is filled into cylindrical bottles of
diameter 6 cm i.e of radius 3 cm

Also, 10% liquid is wasted.

Now, vol^m of the bowl $= \dfrac{2}{3} \times \pi \times (18)^3 = \dfrac{2 \times \pi \times 18 \times 18 \times 18^{6}}{3}$

$= (12 \times 324\,\pi)\ cm^3$

liquid wasted $= \dfrac{10}{100_{5}} \times 12 \times 324^{6}\,\pi$

$= \left(\dfrac{1944\,\pi}{5}\right)\ cm^3$

Now, liquid used to fill the bottles $= \dfrac{(3888\,\pi - 1944\,\pi)}{5}\ cm^3$

$= \left(\dfrac{19440\,\pi - 1944\,\pi}{5}\right)\ cm^3$

$= \dfrac{17496\,\pi}{5}\ cm^3$

Now, Height of to each bottle = $\dfrac{\overset{1944}{\cancel{17496}} \overset{243}{\times} \overset{27}{}\pi}{5 \times \cancel{7} \times \cancel{8} \times \cancel{8} \times \underset{9}{72}}$

$$= \dfrac{27}{5} \text{ cm}$$

$$= 5.4 \text{ cm}$$

14.   No. of orange balls in a jar = 10

Let the no. of red balls = x

"   "   "   "   blue "   = y

Total no. of balls = $10 + x + y$

Now,

Let E be the event of getting a red ball.

$$P(red) = \dfrac{1}{4} \Rightarrow \dfrac{x}{x+y+10} = \dfrac{1}{4}$$

$$\Rightarrow 4x = x+y+10$$

or, $3x - y - 10 = 0$ —①

Again, $P(blue) = \dfrac{1}{3} \Rightarrow \dfrac{y}{x+y+10} = \dfrac{1}{3}$

$$\Rightarrow 3y = x+y+10$$

$$\Rightarrow 2y - x - 10 = 0$$ —②

Subtracting (ii) from (i), we get

or, $3x - y - 10 = 0$

or, $-x + 2y - 10 = 0$
$(+) \quad (-) \quad (+)$
_____
$4x - 3y = 0$

or, $4x = 3y$

or, $x = \dfrac{3y}{4}$ ___(iii)

Putting the value of x in (i), we get

or, $3\left(\dfrac{3y}{4}\right) - y = 10$

or, $9y - 4y = 40$

or, $5y = 40 \Rightarrow y = 8$

Putting $y = 8$ in (iii), we get

$x = \dfrac{3 \times 8^{2}}{4} = 6$

$\therefore$ Total no. of balls $= 6 + 8 + 10$

$= 24$

15. Here, side of a cubical block = a = 10 cm

A hemisphere surmounts the cube.

∴ Diameter (largest) of hemisphere = 10 cm

⇒ radius (r) = 5 cm

10 cm

Now, T.S.A of solid = (T.S.A of cube − area of base of hemisphere) + C.S.A of hemisphere

$$= 6a^2 - \pi r^2 + 2\pi r^2$$

$$= 6a^2 + \pi r^2 = 6(10)^2 + \pi(5)^2$$

$$= 600 + 25 \times 3.14$$

$$= 600 + 25 \times 3.14 \frac{157}{\cancel{100} \, 42}$$

$$= \frac{1200 + 157}{2} = \frac{1357}{2} cm^2$$

Now, Rate of painting = Rs 5/100 cm²

∴ Cost " " $= Rs \frac{\cancel{5}^{1}}{\cancel{100}_{20}} \times \frac{1357}{2}$ 33.925

$$= Rs \frac{1357}{4 \times \cancel{100}} = Rs \, 33.925$$

$$= Rs \, 33.93$$

16. Here, coordinates of points A & B are $A(-2,-2)$ and $B(2,-4)$

Hey, P divides AB such that

$$\frac{AP}{AB} = \frac{3}{7} \Rightarrow \frac{AB}{AP} = \frac{7}{3}$$

$$\Rightarrow \frac{AB-AP}{AP} = \frac{7-3}{3}$$

$$or, \frac{BP}{AP} = \frac{4}{3}$$

$$\Rightarrow AP:BP = 3:4$$

$\therefore$ Point P divides AB in the ratio $3:4$

Now, Coordinates of P are

$$P\left[\frac{3\times2+4(-2)}{3+4}, \frac{3(-4)+4(-2)}{3+4}\right]$$

$$= P\left[\frac{6-8}{7}, \frac{-12-8}{7}\right] = P\left(\frac{-2}{7}, \frac{-20}{7}\right)$$

Ans

(17.) Diameter of a cone = 3.5 cm

$$\Rightarrow radius(R) = \frac{3.5}{2} cm$$

Height of cone = H = 3 cm

Here, 504 cones are melted to form a sphere.

Let the radius of sphere = R

Now, Vol^m of sphere = vol^m of 504 cones

or, vol^m of

$$\frac{4}{3} \times R^3 = \frac{\overset{126}{\cancel{504}} \times \frac{1}{\cancel{3}} \times \cancel{\pi} \times 3 \times \frac{3'5}{2} \times \frac{3'5}{2 \times 10}}{}$$

or, $R^3 = \dfrac{126 \times 3 \times 3\overset{7}{5} \times 3\overset{7}{5}}{\underset{\underset{4}{20}}{4 \times 10}} = \dfrac{7 \times 7 \times 7 \times \overset{9}{18} \times 3}{\underset{8}{16}}$

or, $R = \sqrt[3]{\dfrac{7 \times 7 \times 7 \times 3 \times 3 \times 3}{2 \times 2 \times 2}} = \dfrac{7 \times 3}{2} = \dfrac{21}{2}$ cm

$\therefore$ Diameter = 2R = $2 \times \dfrac{21}{2}$ = 21 cm

S.A of hemisphere = $4 \pi R^2$

$= 4\pi \times \dfrac{21}{2} \times \dfrac{21}{2} = \dfrac{22}{7} \times 21 \times 21$

$= 66 \times 21$

$= 1386 \text{ cm}^2$

$\begin{array}{r} 66 \\ 21 \\ \hline 66 \\ 132 \times \\ \hline 135\, \end{array}$

18. In circle with centre O.

ABCD is a rhombus.

As we know that diagonals of a rhombus are perpendicular to each other.

So, AC and BD intersect each other at O.

Now, ar (cir) $= 1256 \text{ cm}^2$

Or, $\pi r^2 = 1256$

Or, $3.14 \times r^2 = 1256$ ⟹ $r^2 = \dfrac{\overset{4}{\cancel{1256}} \times 100}{\cancel{314}}$

⟹ $r = 2 \times 10$

$= 20 \text{ cm}$

Now, diagonals of rhombus $= (2 \times 20) \text{ cm}$

$= 40 \text{ cm}$

∴ area of rhombus ABCD $= \dfrac{1}{2} \times \overset{20}{\cancel{40}} \times 40$

$= 800 \text{ cm}^2$

19. $2x^2 + 6\sqrt{3}x - 60 = 0$

or, $x^2 + 3\sqrt{3}x - 30 = 0$

or, Here, $a = 1$, $b = 3\sqrt{3}$, $c = -30$

Now, $D = b^2 - 4ac$

$$= (3\sqrt{3})^2 - 4 \times 1(-30)$$

$$= 27 + 120 = 147$$

$D > 0$. So, roots are real and distinct.

Now, $X = \dfrac{-b \pm \sqrt{D}}{2a} = \dfrac{-3\sqrt{3} \pm \sqrt{147}}{2}$

$\alpha = \dfrac{-3\sqrt{3} + \sqrt{147}}{2} = \dfrac{-3\sqrt{3} + 7\sqrt{3}}{2} = \dfrac{\sqrt{3}(7-3)}{2} = \dfrac{4\sqrt{3}}{2} = 2\sqrt{3}$

$\beta = \dfrac{-3\sqrt{3} - \sqrt{147}}{2} = \dfrac{-3\sqrt{3} - 7\sqrt{3}}{2} = \dfrac{-\sqrt{3}(7+3)}{2} = \dfrac{10(-\sqrt{3})}{2}$

$$= -5\sqrt{3}$$

20. Let a be the first term and d be the common diff of the given A.P.

Then, $a_{16} = 5 \times a_3$

or, $a + 15d = 5(a + 2d)$

or, $a + 15d = 5a + 10d$

or, $4a - 5d = 0 \Rightarrow 4a = 5d$ —(i)

$$\Rightarrow a = \dfrac{5d}{4} \quad -(1)$$

Given, $a_{10} = 41$

or, $a + 9d = 41$

or, $\dfrac{5d}{4} + 9d = 41$

or, $36d + 5d = \cancel{176}\ 164$

or, $41d = \cancel{176}\ 164$

or, $d = \dfrac{\cancel{176}}{\cancel{41}}\ \dfrac{164}{41} = 4$

Now, Putting $d = 4$ in ①, we get

or, $a = \dfrac{5 \times \cancel{4}}{\cancel{4}} = 5$

Now, $S_{15} = \dfrac{15}{2}\left[2 \times 5 + 14 \times 4\right]$

$= 15\left[5 + 28\right] = \cancel{15 \times 33}$

$= 495\ \underline{An}$

Sec-B.

5. Given, points $A(x,y)$, $B(-5,7)$ and $C(-4,5)$ are collinear.

Now, $x_1 = x$, $y_1 = y$, $x_2 = -5$, $y_2 = 7$, $x_3 = -4$, $y_3 = 5$

or, $ar(\triangle ABC) = 0$

or, $\frac{1}{2}|x_1(y_2-y_3)+x_2(y_3-y_1)+x_3(y_1-y_2)| = 0$

or, $x(7-5)+(-5)(5-y)+(-4)(y-7) = 0$

or, $2x - 25 + 5y - 4y + 28 = 0$

or, $2x + y + 3 = 0$, which is the required relation between x & y.

6. Let a be the first term and d be the common diff. of the given A.P.

Then, Given, $S_5 + S_7 = 167$

$S_{10} = 235$

or, $\frac{\overset{47}{\cancel{10}}}{\cancel{2}}[2a+9d] = 235$

or, $2a + 9d = 47$ — ①

Also, $S_5 + S_7 = 167$

or, $\frac{5}{2}[2a+4d] + \frac{7}{2}[2a+6d] = 167$

or, $5[a+2d] + 7[a+3d] = 167$

or, $12a + 31d = 167$ —⑪

sub. ① from ⑪, we get

or, $12a + 31d = 167$
       $- \underline{2a + 9d = 47}$

     $10a + 22d = 120$

or, $10a + 22d = 120$

or, $5a + 11d = 60 \Rightarrow a = \frac{60-11d}{5}$ —⑪

Putting $a = \frac{60-11d}{5}$ in ⑪, we get

or, $\frac{12(60-11d)}{5} + 31d = 167$

or, $720 - 132d + 155d = 835$

or, $23d = 835 - 720$

       $= 115$

or, $d = 5$

Putting $d = 5$ in ⑪, we get

or, $a = \frac{60 - 11 \times 5}{5}$

    $= \frac{60 - 55}{5} = \frac{5}{5} = 1$

∴ Req. A.P is $a, a+d, a+2d \cdots$

$1, 1+5, 1+2\times5 \cdots$
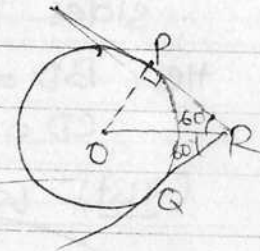

$0, 5, 10 \cdots$

$1, 6, 11 \cdots$

7. Given, RQ and RP are tangents to the circle $C(O,r)$ at Q & P respectively.

$\angle PRQ = 120°$

To prove:- $OR = PR + RQ$

Const:- We draw $OP \perp PR$

Proof:- As we know that tangents subtend equal $\angle s$ to the line segment joining the point and the centre of the circle.

$\therefore \angle ORP = 60°$

Now, In right $\triangle OPR$,

$$\cos 60° = \frac{PR}{OR} \Rightarrow \frac{1}{2} = \frac{PR}{OR}$$

$$\Rightarrow 2PR = OR$$

$$\Rightarrow PR + RQ = OR$$

$(\because PR = RQ$ tangents from R)
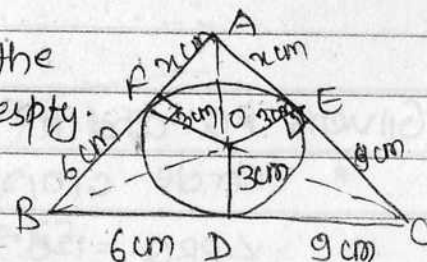

proved

8. Given, Circle with centre o touches the
sides BC, AC & AB at D, E & P respty.

Hey BD = 06 cm

CD = 9 cm , ar($\triangle ABC$) = 54 cm²

Const:- We draw OE $\perp$ AC & OF $\perp$ AB

We join OA, OB & OC

To find:- AB & AC

Sol':-

Hey, BF = BD = 6 cm (tangents from B)

CD = CE = 9 cm (tangents from C)

Let AE = AF = x cm (tangents from A)

Now, AB = $(x+6)$ cm, BC = 15 cm

AC = $(9+x)$ cm

or ar($\triangle ABC$) = ar($\triangle AOB$) + ar($\triangle BOC$) + ar($\triangle AOC$)

or 54 = $\frac{1}{2} \times OD \times (x+6) + \frac{1}{2} \times OD + 15 \cdot + \frac{1}{2} \times OD \times (x+9)$

or 54 = $\frac{\overset{18}{\cancel{3}}}{2}[x+6+15+x+9]$

or, 36 = 30 + 2x

or, 2x = 6

or, x = 3

$$\therefore AB = (x+6) \text{ cm} = (3+6) \text{ cm} = 9 \text{ cm}$$
$$AC = (x+9) \text{ cm} = (3+9) \text{ cm} = 12 \text{ cm}$$

9. $4x^2 + 4bx - (a^2 - b^2) = 0$

Here, $a = 4$, $b = 4b$, $c = -(a^2 - b^2)$

$$D = b^2 - 4ac$$
$$= (4b)^2 + 4 \times 4(a^2 - b^2)$$
$$= 16b^2 + 16a^2 - 16b^2 = 16a^2 = (4a)^2$$

$\therefore D > 0$. So, roots are real & distinct.

Now, $X = \dfrac{-b \pm \sqrt{D}}{2a} = \dfrac{-4b \pm \sqrt{(4a)^2}}{2 \times 4} = \dfrac{-4b \pm \sqrt{(4a)^2}}{8}$

$$\alpha = \dfrac{-4b + 4a}{8} = \dfrac{4(a-b)}{8_2} = \dfrac{a-b}{2}$$

$$\beta = \dfrac{-4b - 4a}{8} = \dfrac{4(-a-b)}{8_2} = \dfrac{-(a+b)}{2}$$

10. Let $A(4,3)$, $B(-1,y)$ and $C(3,4)$ be the vertices of a right $\triangle ABC$ right-angled at A.

Now, By pythagoras theorem,

$$BC^2 = AB^2 + AC^2$$

or, $(-1-3)^2 + (y-4)^2 = (4+1)^2 + (3-y)^2 + (4-3)^2 + (3-4)^2$

or, $(-4)^2 + (y-4)^2 = (5)^2 + (3-y)^2 + 1 + 1$

or, $16 + y^2 + 16 - 8y = 25 + 9 + y^2 - 6y + 2$

or, $32 - 2y = 36$

or, $2y = -4$

or, $y = -2$ / Ans
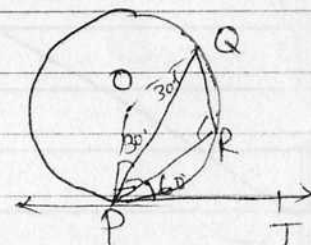

or, $x = 3$

Sec-A.

1. $120°$

2.

1. Given, $\angle QPT = 60°$

Then, $\angle OPQ = 30°$

$\therefore \angle POQ = 120°$

So, ref $\angle POQ = 240°$

$\therefore \angle PRQ = 120°$ Ar.

$\angle PRQ = 120°$

2. $D = 0$ (for equal roots)

$\Rightarrow (-2\sqrt{5}p)^2 - 4p \times 15 = 0$

or, $4 \times 5p^2 - 60p = 0$
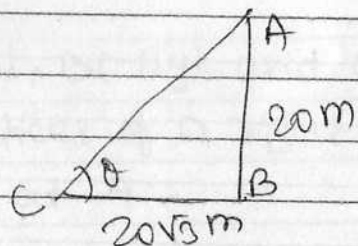

or, $20p^2 - 60p = 0$

or, $20p(p-3) = 0$

or, $20p = 0$ | or, $p = 3$

or, $p = 0$

(invalid) $\therefore p = 3$

3.

$\tan \theta = \dfrac{20}{20\sqrt{3}} = \dfrac{1}{\sqrt{3}}$

$\Rightarrow \tan \theta = \tan 30°$

$\theta = 30°$

So, sun's altitude = 30°

4. Two dice are tossed together.

All possible outcomes are (1,1), (1,2) . . . . (6,6)

Total no. of " = 36

Let E be the event of getting the product of 2 no's on top is 6

Then, favourable outcomes = (1,6), (2,3), (3,2), (6,1)

No. of " " = 4

$P(E) = \dfrac{4}{36} = \dfrac{1}{9}$ ✦
